load("C:/Users/lucab/Downloads/stomach_dataset.Rdata")
```

```
sprat <- stom_df %>% filter(pred_taxa=="Lophius piscatorius")
```

```
ggplot(sprat, aes(x=pred_weight_g, y=log(ppmr)))+  
  geom_point()+  
  geom_smooth(method="gam", se=FALSE, aes(weight = nprey_perpred))+  
  labs(title="logPPMR vs Predator Weight", x="Predator Weight (g)", y="logPPMR")
```

```
## 'geom_smooth()' using formula = 'y ~ s(x, bs = "cs")'
```

```
dig <- 1

ggplot(sprat, aes(x=pred_weight_g, y=log(ppmr)))+
  geom_point()+
  facet_wrap(~data)+
  geom_smooth(method="gam", se=FALSE, aes(weight = nprey_perpred*sprat$prey_ind_weight_g^dig))+
  labs(title="logPPMR vs Predator Weight", x="Predator Weight (g)", y="logPPMR")
```

```
## Warning: Use of 'sprat$prey_ind_weight_g' is discouraged.
## i Use 'prey_ind_weight_g' instead.
```

```
## 'geom_smooth()' using formula = 'y ~ s(x, bs = "cs")'
```

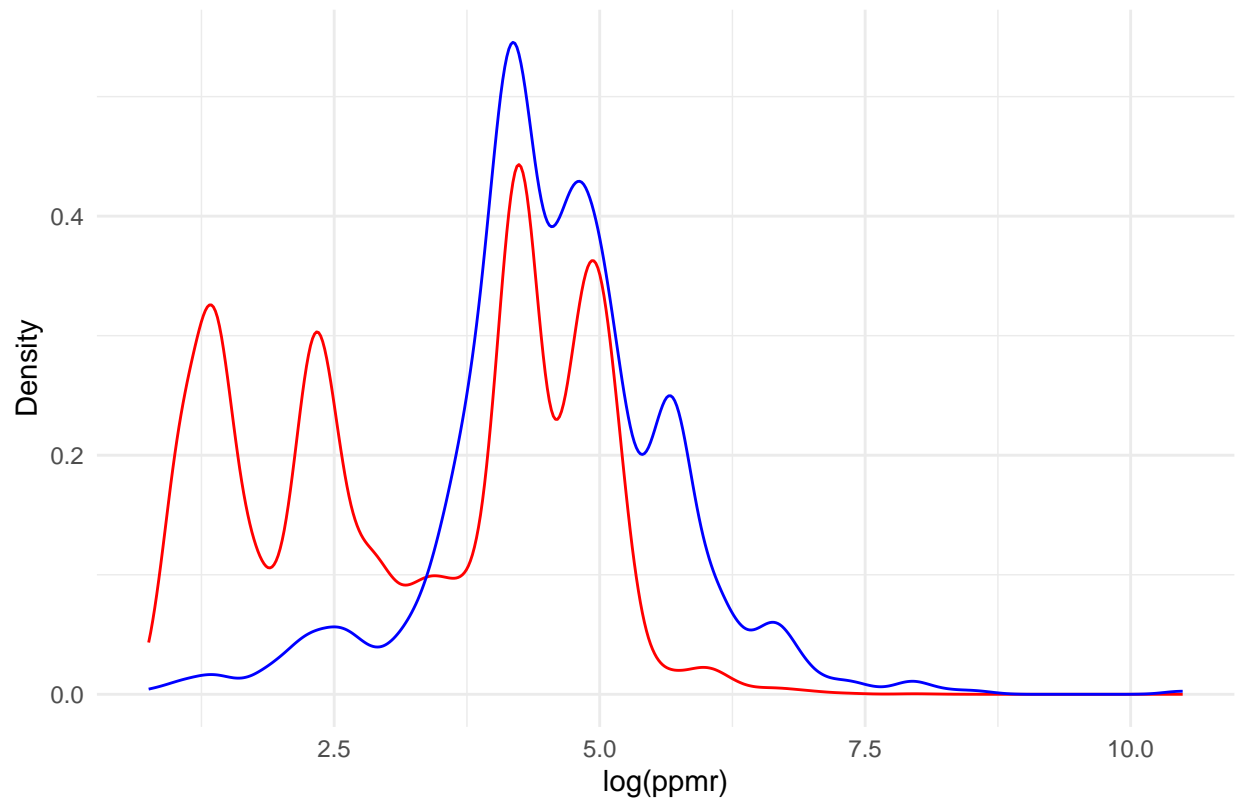

The diet PPMR actually is less consistent across predator sizes.

```
sprat$weight_numbers <- sprat$nprey_perpred
sprat$weight_biomass <- sprat$nprey_perpred*sprat$prey_ind_weight_g^dig

ggplot() +
  geom_density(data = sprat, aes(x = log(ppmr), weight = weight_biomass), color = "red") +
  geom_density(data = sprat, aes(x = log(ppmr), weight = weight_numbers), color = "blue") +
  labs(title = "Density Plot of log(ppmr) Weighted by Biomass and Numbers",
       x = "log(ppmr)",
       y = "Density") +
  theme_minimal()
```

Density Plot of log(ppmr) Weighted by Biomass and Numbers

This looks very hard to model. Maybe 3 gaussians?

```
library(mclust)
```

```
## Warning: package 'mclust' was built under R version 4.3.3
```

```
## Package 'mclust' version 6.1.1
```

```
## Type 'citation("mclust")' for citing this R package in publications.
```

```
repeat_elements <- function(data, weights) {  
  valid_indices <- !is.na(data) & !is.na(weights)  
  data <- data[valid_indices]  
  weights <- weights[valid_indices]  
  
  final_vector <- c()  
  
  for (i in seq_along(data)) {  
    rounded_weight <- round(weights[i])  
    repeated_values <- rep(data[i], times = rounded_weight)  
    final_vector <- c(final_vector, repeated_values)  
  }  
}
```

```

    return(final_vector)
  }

  spratnu <- repeat_elements(log(sprat$ppmr), sprat$npred_perpred)

  gmm <- densityMclust(spratnu, G=3)

```

```

dplot <- data.frame(x=gmm[["data"]], density=gmm[["density"]])

(numbfitt <- ggplot() +
  geom_density(data=sprat, aes(log(ppmr), weight=weight_numbers), fill="lightblue")+
  geom_line(data=dplot, aes(x = x, y = density), color="red") +
  labs(x = "Values", y = "Density") +
  ggtitle("Number Density Plot from Number Distribution"))

```

Number Density Plot from Number Distribution

Now lets shift over.

```
newspratdens <- gmm[["density"]]*exp(-dig*gmm[["data"]])
shifted_pdf_normalized <- newspratdens / sum(newspratdens)

#making new dataframe
dplot <- data.frame(x=gmm[["data"]], density=shifted_pdf_normalized)

(numbfitbio <- ggplot() +
  geom_density(data=sprat, aes(log(ppmr), weight=weight_biomass), fill="lightblue")+
  geom_density(data=dplot, aes(x, weight=shifted_pdf_normalized), fill="red", alpha=0.5)+
  #geom_line(data=dplot, aes(x = x, y = density), color="red") +
  labs(x = "Values", y = "Density") +
  ggtitle("Diet Density Plot from Number Distribution"))
```

This doesnt shift well. Will try shift from biomass to number.

```
spratnu <- repeat_elements(log(sprat$ppmr), sprat$npred_perpred*sprat$prey_ind_weight_g^dig)
gmm <- densityMclust(spratnu, G=3)
```

```
